

## **CE EMC Test Report**

Issued date: Mar. 12, 2024 Project No.: 24Q013104

E

**Product :** MediaTek Genio 1200 Carrier Board

Model: ESOM-MT-1200-CB

can be 0-9, A-Z, - or blank for marketing and customized purpose) Applicant: Vecow Co., Ltd

Address: 3F, No. 10, Jiankang Rd., Zhonghe Dist., New Taipei City 23586, Taiwan

#### Report No: WD-EE-R-240065-A0

#### According to

EN 55032: 2015 + A11: 2020, Class A BS EN 55032: 2015 + A11: 2020 **CISPR 32: 2015 AS/NZS CISPR 32: 2015** EN 61000-3-2: 2014 EN IEC 61000-3-2: 2019 + A1: 2021 EN 61000-3-3: 2013 + A1: 2019 + A2: 2021 BS EN 61000-3-2: 2014 BS EN IEC 61000-3-2: 2019 + A1: 2021 BS EN 61000-3-3: 2013 + A1: 2019 + A2: 2021 EN 55035: 2017 + A11: 2020 BS EN 55035: 2017 + A11: 2020

The above equipment (Model: ESOM-MT-1200-CB) has been tested by **Wendell EMC & RF Laboratory**, and found compliance with the requirement of the above standards. The test record, data evaluation and Equipment Under Test (EUT) configurations represented herein are true and accurate accounts of the measurements of the sample's EMC characteristics under the conditions specified in this report.

Please note that the measurement uncertainty are provided for informational purpose only and are not used in determining the Pass/Fail results.

## 1.1 Summary of Test Result

The EUT has been tested according to the following specifications:

| Emission           |   |         |        |   |
|--------------------|---|---------|--------|---|
| Standard Test Item |   | Limit   | Result | Remark  |
| EN 55032           | Conducted disturbance at mains terminals              | Class A | Pass   | Meets the requirements  |
| CISPR 32           | Conducted disturbance at telecommunication ports test | Class A | Pass   | Meets the requirements  |
| 01511(52           | Radiated disturbance                                  | Class A | Pass   | Meets the requirements  |
| EN 61000-3-2       | Harmonic current emissions                            | Class A | Pass   | The power consumption of EUT is less than 75W and no limits apply |
| EN 61000-3-3       | Voltage fluctuations and flicker                      | -       | Pass   | Meets the requirements  |

| Immunity       |   |        |   |  |  |
|----------------|---|--------|---|--|--|
| Standard       | Test Item                                 | Result | Remark  |  |  |
| IEC 61000-4-2  | Electrostatic discharges (ESD)            | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-3  | Continuous radiated disturbances (RS)     | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-4  | Electrical fast transients (EFT)          | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-5  | Surges                                    | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-6  | Continuous conducted disturbances (CS)    | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-8  | Power-frequency magnetic fields<br>(PFMF) | Pass   | Meets the requirements of<br>Performance Criterion A  |  |  |
| IEC 61000-4-11 | Voltage dips and interruptions            | Pass   | <ul> <li>Meets the requirements of</li> <li>Voltage Dips:</li> <li> &gt;95% reduction –<br/>Performance Criterion A </li> <li> 30% reduction -<br/>Performance Criterion C </li> <li>Voltage Interruptions:<br/>&gt;95% reduction –<br/>Performance Criterion C </li> </ul> |  |  |

Note: Test record contained in the referenced test report relate only to the EUT sample and test item.

ſE

## 2 Test Configuration of Equipment Under Test

#### 2.1 Test Facility

Conducted disturbance at mains terminals, Conducted disturbance at telecommunication ports, Harmonics, Flicker, ESD, EFT, Surge, CS, PFMF and DIP Tests

W01: 5F-1, No.188, Baoqiao Rd., Xindian Dist., New Taipei City 23145, Taiwan (R.O.C)

#### **RS** Test

W05: 1F-7, No.188, Baoqiao Rd., Xindian Dist., New Taipei City 23145, Taiwan (R.O.C)

## Conducted disturbance at mains terminals, Conducted disturbance at telecommunication ports and Radiated emission (9\*6\*6 Chamber) Tests

W08: No.119, Wugong 3rd Rd., Wugu Dist., New Taipei City 248, Taiwan (R.O.C)

#### ACCREDITATIONS

The laboratories are accredited and approved by the TAF according to ISO/IEC 17025.

#### 2.2 Measurement Uncertainty

The measurement instrumentation uncertainty is evaluated according to CISPR 16-4-2.

This uncertainty represents an expanded uncertainty expressed at approximately the 95% confidence level using a coverage factor of k=2.

Wendell EMC & RF Laboratory  $U_{lab}$  is less than  $U_{cispr}$ , therefore compliance or non-compliance with a disturbance limit shall be determined in the following manner.

- compliance is deemed to occur if no measured disturbance level exceeds the disturbance limit;
- non-compliance is deemed to occur if any measured disturbance level exceeds the disturbance limit.

Please note that the measurement uncertainty ( $U_{lab}$ ) is provided for informational purpose only and is not used in determining the Pass/Fail results.

#### 2.2.1 Conducted Emission test

| Test Site | Measurement Freq. Range | dB (U <sub>lab</sub> ) | Note |
|-----------|-------------------------|------------------------|------|
| W01-CE    | 150 kHz ~ 30 MHz        | 2.75                   | N/A  |
| W08-CE    | 150 kHz ~ 30 MHz        | 2.76                   | N/A  |

#### 2.2.2 Conducted emission at telecom port test

| Test Site | Measurement Freq. Range | dB (U <sub>lab</sub> ) | Note |
|-----------|-------------------------|------------------------|------|
| W01-CE    | 150 kHz ~ 30 MHz        | 2.74                   | N/A  |
| W08-CE    | 150 kHz ~ 30 MHz        | 2.92                   | N/A  |

#### 2.2.3 Radiated Emission test

| Test Site | Measurement Freq. Range | Ant | dB (U <sub>lab</sub> ) | Note |
|-----------|-------------------------|-----|------------------------|------|
|           | 30 MHz ~ 200 MHz        | V   | 3.78                   | N/A  |
|           | 30 MHz ~ 200 MHz        | Н   | 2.69                   | N/A  |
| W08-966-1 | 200 MHz ~ 1000 MHz      | V   | 4.91                   | N/A  |
|           | 200 MHz ~ 1000 MHz      | Н   | 3.40                   | N/A  |
|           | 1 GHz ~ 6 GHz           | V   | 4.48                   | N/A  |
|           | 1 GHz ~ 6 GHz           | Н   | 4.33                   | N/A  |

## **3** General Information

## **3.1 Description of EUT**

| Product                 | MediaTek Genio 1200 Carrier Board  |
|-------------------------|--|
| Model                   | ESOM-MT-1200-CB  |
| Series Model            | ESOM-MT-1200 Series, ESOM-MT-1200XXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXXX   |
| Applicant               | Vecow Co., Ltd   |
| Received Date           | Feb. 16, 2024  |
| EUT Power Rating        | 12Vdc (from adapter)   |
| Model Differences       | The models are electrically identical, different models no. are for marketing purpose. The series model information is provided by client. |
| <b>Operating System</b> | Linux Yocto 3.1  |
| Data Cable Supplied     | N/A  |
| Accessory Device        | N/A  |
| I/O Port                | Please refer to the User's Manual  |

#### Note:

1. The EUT uses the follow adapter:

| Adapter (support unit only) |   |  |  |
|-----------------------------|---|--|--|
| Brand                       | LITEON  |  |  |
| Model                       | HA-1600-12  |  |  |
| Input Power                 | 100-240Vac, 1.7A, 50-60Hz   |  |  |
| Output Power                | 12Vdc, 5.0A, 60.0W  |  |  |
| Power line                  | Input: 1.8m non-shielded cable<br>Output: 1m non-shielded cable with 1 core |  |  |

2. The EUT's highest operating frequency is 2.2GHz. Therefore the radiated emission is tested up to 6GHz.

### **3.2 Description of Test Modes**

Test results are presented in the report as below.

| Test Mode | Test Condition                               |  |  |  |  |  |
|-----------|--|--|--|--|--|--|
|           | Conducted emission test                      |  |  |  |  |  |
| -         | Adapter mode                                 |  |  |  |  |  |
|           | Conducted emission test at telecom port test |  |  |  |  |  |
| -         | Adapter mode, LAN (10Mbps/100Mbps/1Gbps)     |  |  |  |  |  |
|           | Radiated emission 30MHz ~ 1GHz test          |  |  |  |  |  |
| -         | Adapter mode                                 |  |  |  |  |  |
|           | Radiated emission above 1GHz test            |  |  |  |  |  |
| -         | Adapter mode                                 |  |  |  |  |  |
|           | Harmonics, Flicker and Immunity test         |  |  |  |  |  |
| -         | Adapter mode                                 |  |  |  |  |  |

#### **3.3 EUT Operating Condition**

- a. Inserted the EUT into the enclosure and placed on test table.
- b. Prepare PC & NB to act as a communication partner and placed it outside of testing area.
- c. The EUT was connected to the PC & NB with LAN cable.
- d. The communication partner sent data to EUT by command "ping" via LAN.
- e. The EUT run test program "BurnIN.exe" to enable all functions.
- f. The EUT sent "Color Bar ITU-R.BT471-1" signal to monitor and displayed on screen.
- g. The EUT sent voice signal to earphone.

## 3.4 Description of Support Unit

|      | the EUT has been conducted testing with other necessary accessories or support units. |          |                  |                                      |                     |   |   |                       |  |  |
|------|---|----------|------------------|--------------------------------------|---------------------|---|---|-----------------------|--|--|

| 9    | RS232<br>terminator   | N/A      | N/A              | N/A                                  | N/A                 | N/A   | N/A   | Supplied<br>by client |  |  |

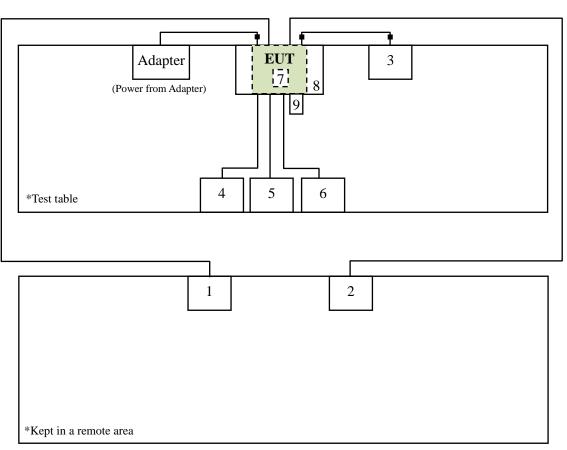

The EUT has been conducted testing with other necessary accessories or support units.

**Note:** 1. The core(s) is(are) originally attached to the cable(s).

2. Item 1-2 acted as communication partners to transfer data.

## 3.5 Configuration of System Under Test

## 4 Emission Test

#### 4.1 Conducted Emission Measurement

#### 4.1.1 Limit of Conducted Emission Measurement

Class A equipment:

| Require         | Requirements for conducted emissions from the AC mains power ports<br>of Class A equipment |                             |                |  |  |  |  |
|-----------------|--|-----------------------------|----------------|--|--|--|--|
|                 | Me   | asurement                   | Class A limits |  |  |  |  |
| Frequency (MHz) | Coupling<br>device   | Detector type/<br>bandwidth | dB(µV)         |  |  |  |  |
| 0.15 to 0.5     | AMN  | Quasi Peak / 9 kHz          | 79             |  |  |  |  |
| 0.5 to 30       | Alvin  | Quasi Peak / 9 kHz          | 73             |  |  |  |  |
| 0.15 to 0.5     | AMN  | Average / 9 kHz             | 66             |  |  |  |  |
| 0.5 to 30       |  | Average / 9 KHZ             | 60             |  |  |  |  |

Class B equipment:

| Requirements for conducted emissions from the AC mains power ports<br>of Class B equipment |                    |                             |                |  |  |  |
|--|--------------------|-----------------------------|----------------|--|--|--|
|  | Me                 | asurement                   | Class B limits |  |  |  |
| Frequency (MHz)  | Coupling<br>device | Detector type/<br>bandwidth | dB(µV)         |  |  |  |
| 0.15 to 0.5  | AMN                |                             | 66 to 56*      |  |  |  |
| 0.5 to 5   |                    | Quasi Peak / 9 kHz          | 56             |  |  |  |
| 5 to 30  |                    |                             | 60             |  |  |  |
| 0.15 to 0.5  |                    |                             | 56 to 46*      |  |  |  |
| 0.5 to 5   | AMN                | Average / 9 kHz             | 46             |  |  |  |
| 5 to 30  |                    |                             | 50             |  |  |  |

\* Decreases with the logarithm of the frequency.

**Note:** 1. The lower limit shall apply at the transition frequencies.

- 2. Detector function in the form: PK = Peak, QP = Quasi Peak, AV = Average
- 3. The test result calculated as following:
- Measurement Value = Reading Level + Correct Factor Correction Factor = Insertion loss of LISN + Cable loss + Transient Limiter (If use) Margin Level = Measurement Value –Limit Value

## 4.1.2 Test Instrument

**Note:** 1. The calibration interval of the above test instruments is 12 months.

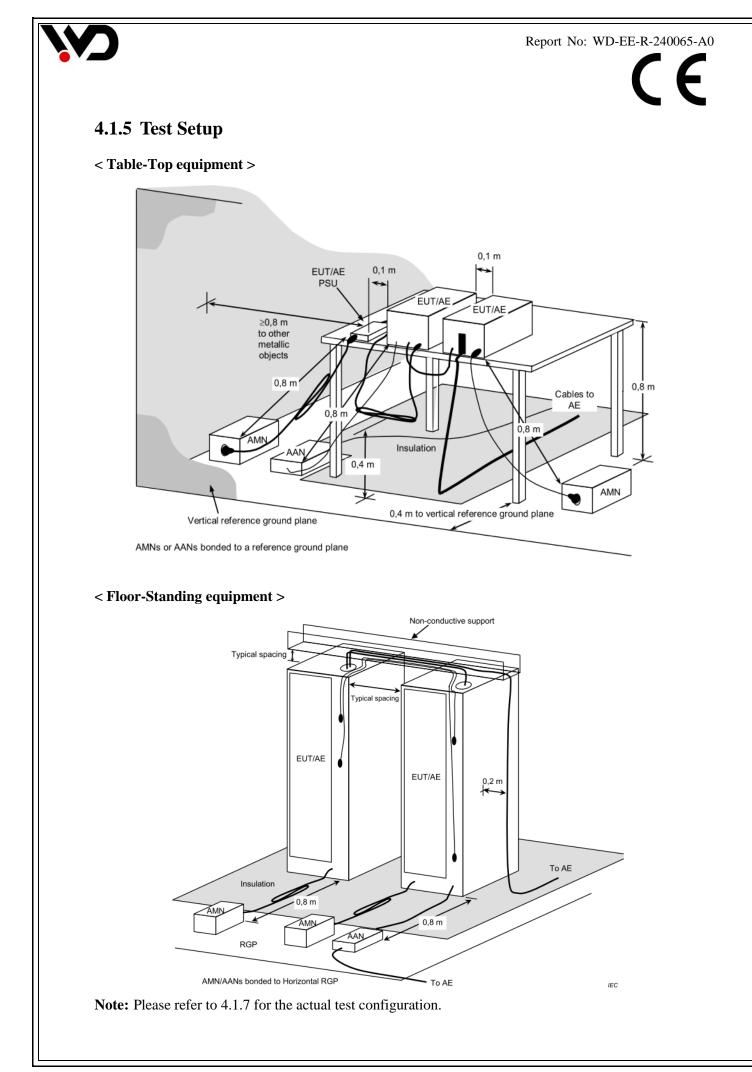

E

### 4.1.3 Test Procedure

- a. The table-top EUT was placed 0.8 meter height wooden table from the horizontal ground plane with EUT being connected to power source through a line impedance stabilization network (LISN). The floor-standing EUT was placed insulation support unit from the horizontal ground plane. The LISN at least be 80 cm from nearest chassis of EUT.
- b. The line impedance stabilization network (LISN) provides 50 ohm/50uH of coupling impedance for the measuring instrument. All other support equipments powered from additional LISN(s).
- c. Interrelating cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle. All I/O cables were positioned to simulate typical usage.
- d. All I/O cables that are not connected to a peripheral shall be bundle in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.
- e. The EMI test receiver connected to LISN powering the EUT. The actual test configuration, please refer to EUT test photos.
- f. The receiver scanned from 150kHz to 30MHz for emissions in each of test modes. A scan was taken on both power lines, Line and Neutral, recording at least six highest emissions.
- g. The EUT and cable configuration of the above highest emission levels were recorded. The test data of the worst case was recorded.

#### 4.1.4 Deviation from Test Standard

No deviation

## 4.2 Conducted Emission at Telecommunication Ports Test

#### 4.2.1 Limit of Conducted Emission at Telecommunication Ports Test

Class A equipment:

| R               | Requirements for asymmetric mode conducted emissions<br>from Class A equipment |                             |                |  |  |  |  |
|-----------------|--|-----------------------------|----------------|--|--|--|--|
|                 | Measurement  |                             | Class A limits |  |  |  |  |
| Frequency (MHz) | Coupling<br>device   | Detector type/<br>bandwidth | dB(µV)         |  |  |  |  |
| 0.15 to 0.5     |  | Quasi Peak / 9 kHz          | 97 to 87*      |  |  |  |  |
| 0.5 to 30       | AAN  | Quasi Feak / 9 KHZ          | 87             |  |  |  |  |
| 0.15 to 0.5     | AAN  | Average / 9 kHz             | 84 to 74*      |  |  |  |  |
| 0.5 to 30       | AAN  | Average / 9 KHZ             | 74             |  |  |  |  |

\* Decreases with the logarithm of the frequency.

#### Class B equipment:

| Requirements for asymmetric mode conducted emissions<br>from Class B equipment |                    |                             |                |  |  |  |
|--|--------------------|-----------------------------|----------------|--|--|--|
|  | Me                 | asurement                   | Class B limits |  |  |  |
| Frequency (MHz)  | Coupling<br>device | Detector type/<br>bandwidth | dB(µV)         |  |  |  |
| 0.15 to 0.5  | AAN                | Quasi Peak / 9 kHz          | 84 to 74*      |  |  |  |
| 0.5 to 30  | AAN                | Quasi Feak / 9 KHZ          | 74             |  |  |  |
| 0.15 to 0.5  | AAN                | Avorago / 0 kHz             | 74 to 64*      |  |  |  |
| 0.5 to 30  | AAN                | Average / 9 kHz             | 64             |  |  |  |

\* Decreases with the logarithm of the frequency.

Note: 1. The lower limit shall apply at the transition frequencies.

- 2. Detector function in the form: PK = Peak, QP = Quasi Peak, AV = Average
- 3. The test result calculated as following:
  - Measurement Value = Reading Level + Correct Factor
  - Correction Factor = Insertion loss of ISN + Cable loss

Margin Level = Measurement Value –Limit Value

**Note:** 1. The calibration interval of the above test instruments is 12 months.

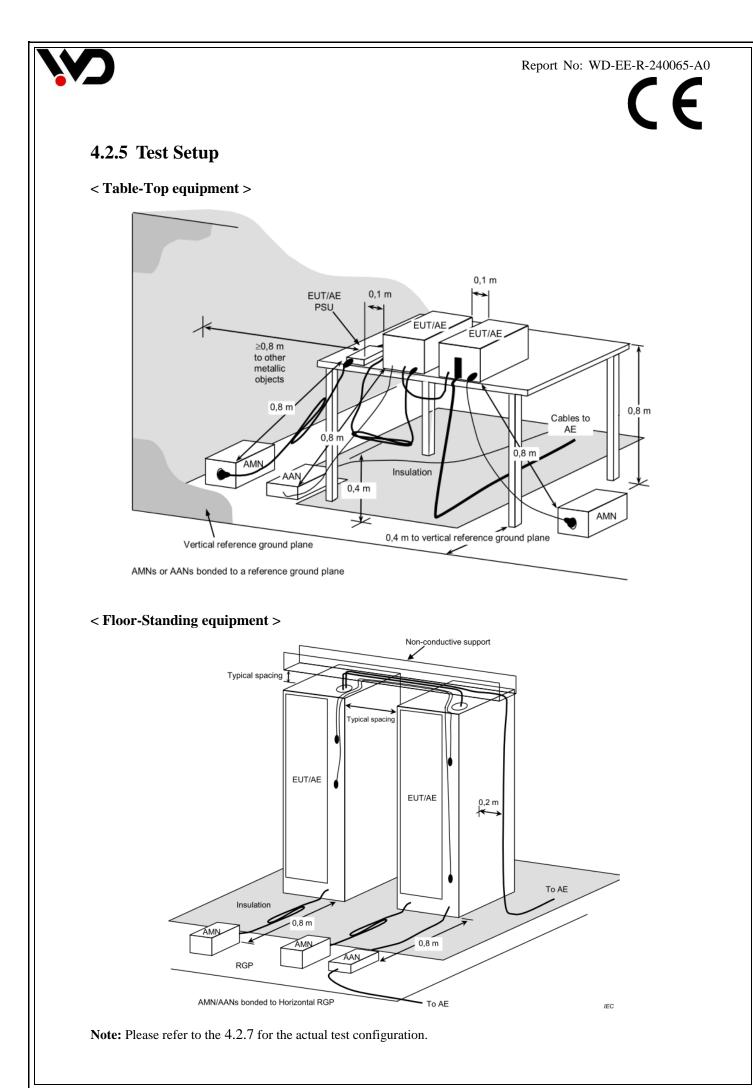

F

### 4.2.3 Test Procedure

- a. The table-top EUT was placed 0.8 meter height wooden table from the horizontal ground plane with EUT being connected to power source through a line impedance stabilization network (LISN). The floor-standing EUT was placed insulation support unit from the horizontal ground plane. The LISN at least be 80 cm from nearest chassis of EUT.
- b. The line impedance stabilization network (LISN) provides 50 ohm/50uH of coupling impedance for the measuring instrument. All other support equipments powered from additional LISN(s).
- c. Interrelating cables that hang closer than 40 cm to the ground plane shall be folded back and forth in the center forming a bundle. All I/O cables were positioned to simulate typical usage.
- d. All I/O cables that are not connected to a peripheral shall be bundle in the center. The end of the cable may be terminated, if required, using the correct terminating impedance. The overall length shall not exceed 1 m.
- e. ISN at least 80 cm from nearest chassis of EUT. The communication function of EUT was executed in normal condition. ISN was connected between EUT and associated equipment and ISN was connected directly to reference ground plane. The actual test configuration, please refer to EUT test photos.
- f. The receiver scanned from 150kHz to 30MHz for emissions in each of test modes. The test mode included 10Mbps, 100Mbps, 1Gbps, 10Gbps and POE mode. Emission frequency and amplitude were recorded, recording at least six highest emissions.
- g. The EUT and cable configuration of the above highest emission levels were recorded. The test data of the worst case was recorded.

#### 4.2.4 Deviation from Test Standard

No deviation

#### 4.3 Radiated Emission Measurement

#### 4.3.1 Limits of Radiated Emission Measurement

According to EN 55032 table1 - Required highest frequency for radiated measurement:

| Highest internal frequency<br>(F <sub>x</sub> ) | Highest measured frequency              |  |  |
|---|---|--|--|
| $F_x \le 108 \ MHz$                             | 1 GHz                                   |  |  |
| $108 \text{ MHz} < F_x \leq 500 \text{ MHz}$    | 2 GHz                                   |  |  |
| $500 \text{ MHz} < F_x \leq 1 \text{ GHz}$      | 5 GHz                                   |  |  |
| $F_x > 1 \text{ GHz}$                           | $5 \times F_x$ up to a maximum of 6 GHz |  |  |

Remark:

1. Fx : highest fundamental frequency generated or used within the EUT or highest frequency at which it operates.

2. Where Fx is unknown, the radiated emission measurements shall be performed up to 6 GHz.

#### Class A equipment:

| Requirements for radiated emissions at frequencies up to 1 GHz<br>for Class A equipment |                 |                             |                         |  |
|---|-----------------|-----------------------------|-------------------------|--|
|   | Measurement     |                             | Class A limits dB(µV/m) |  |
| Frequency (MHz)   | Distance<br>(m) | Detector type/<br>bandwidth | OATS/SAC                |  |
| 30 to 230   | 10              | Quasi Peak /<br>120 kHz     | 40                      |  |
| 230 to 1000   | 10              |                             | 47                      |  |
| 30 to 230   | 3               |                             | 50                      |  |
| 230 to 1000   | 5               |                             | 57                      |  |

| Requirements for radiated emissions at frequencies above 1 GHz<br>for Class A equipment |                 |                             |                         |  |
|---|-----------------|-----------------------------|-------------------------|--|
|   | Measurement     |                             | Class A limits dB(µV/m) |  |

| 1000 to 3000  |                 | Average /<br>1 MHz          | 56                      |  |
| 3000 to 6000  | 3               |                             | 60                      |  |
| 1000 to 3000  |                 | Peak /<br>1 MHz             | 76                      |  |
| 3000 to 6000  |                 |                             | 80                      |  |

#### Class B equipment:

| Requirements for radiated emissions at frequencies up to 1 GHz<br>for Class B equipment |                 |                             |                         |  |
|---|-----------------|-----------------------------|-------------------------|--|
|   | Measurement     |                             | Class B limits dB(µV/m) |  |
| Frequency (MHz)   | Distance<br>(m) | Detector type/<br>bandwidth | OATS/SAC                |  |
| 30 to 230   | 10              | Quasi Peak /<br>120 kHz     | 30                      |  |
| 230 to 1000   | 10              |                             | 37                      |  |
| 30 to 230   | 3               |                             | 40                      |  |
| 230 to 1000   | 3               |                             | 47                      |  |

| Requirements for radiated emissions at frequencies above 1 GHz<br>for Class B equipment |                 |                             |                         |  |
|---|-----------------|-----------------------------|-------------------------|--|
|   | Measurement     |                             | Class B limits dB(µV/m) |  |
| Frequency (MHz)   | Distance<br>(m) | Detector type/<br>bandwidth | FSOATS                  |  |
| 1000 to 3000  | 3               | Average /<br>1 MHz          | 50                      |  |
| 3000 to 6000  |                 |                             | 54                      |  |
| 1000 to 3000  |                 | Peak /<br>1 MHz             | 70                      |  |
| 3000 to 6000  |                 |                             | 74                      |  |

**Note:** 1. The lower limit shall apply at the transition frequency.

2. Detector function in the form: PK = Peak, QP = Quasi Peak, AV = Average

3. The test result calculated as following:

Measurement Value = Reading Level + Correct Factor

 $\begin{array}{l} Correction \ Factor = Antenna \ factor + Cable \ loss \ (Antenna \ to \ preamplifier \ ) \ - \ preamplifier \ Gain \\ + \ Cable \ loss \ (preamplifier \ to \ receiver \ ) \end{array}$ 

Margin Level = Measurement Value - Limit Value

Note: 1. The calibration interval of the above test instruments is 12 months.

### 4.3.3 Test Procedure

- a. The table-top EUT was placed on the top of a turntable 0.8 meters above the ground at 3 m 966 chamber. The floor-standing EUT was placed insulation support unit from the horizontal ground plane. The table was rotated 360 degrees to determine the position of the high radiation emissions.
- b. The height of the test antenna shall vary between 1 m to 4 m. Both vertical and horizontal polarizations of the antenna were set to make the measurement.
- c. The EUT was set up as per the test configuration to simulate typical usage per the user's manual. All I/O cables were positioned to simulate typical usage. The actual test configuration, please refer to EUT test photos.
- d. The initial step in collecting radiated emission data is a Spectrum Mode scanning the measurement frequency range.

#### Below 1GHz:

Reading in which marked as QP or Peak means measurements by using Spectrum Mode with detector RBW=120kHz.

If the Spectrum Mode measured peak value compliance with and lower than Quasi Peak Limit, the EUT shall be deemed to meet QP Limits.

#### Above 1GHz:

Reading in which marked as Peak & AVG means measurements by using Spectrum Mode with setting in RBW=1MHz.

If the Spectrum Mode measured value compliance with the Peak Limits and lower than AVG Limits, the EUT shall be deemed to meet both Peak and AVG Limits.

e. Emission frequency and amplitude were recorded, recording at least six highest emissions. The EUT and cable configuration of the above highest emission levels were recorded. The test data of the worst case was recorded.

#### 4.3.4 Deviation from Test Standard

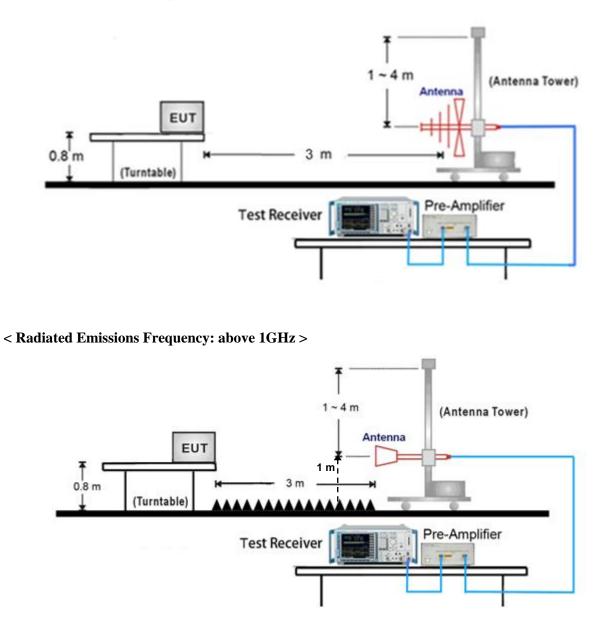

No deviation

**(** 

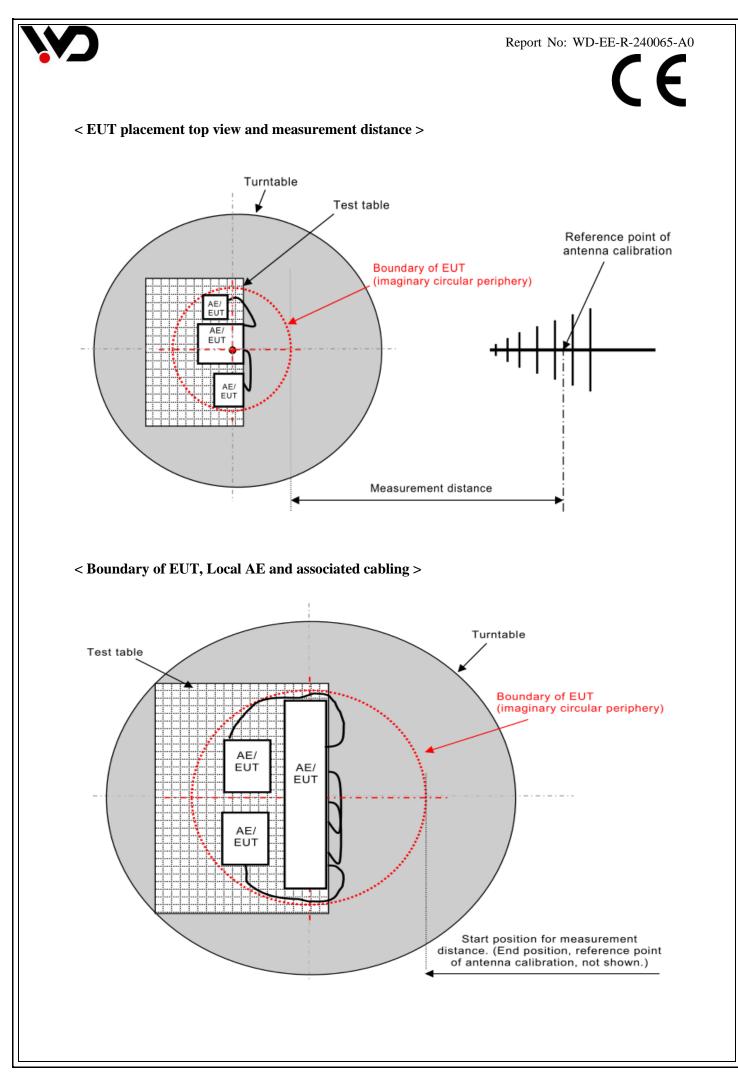

#### 4.3.5 Test Setup

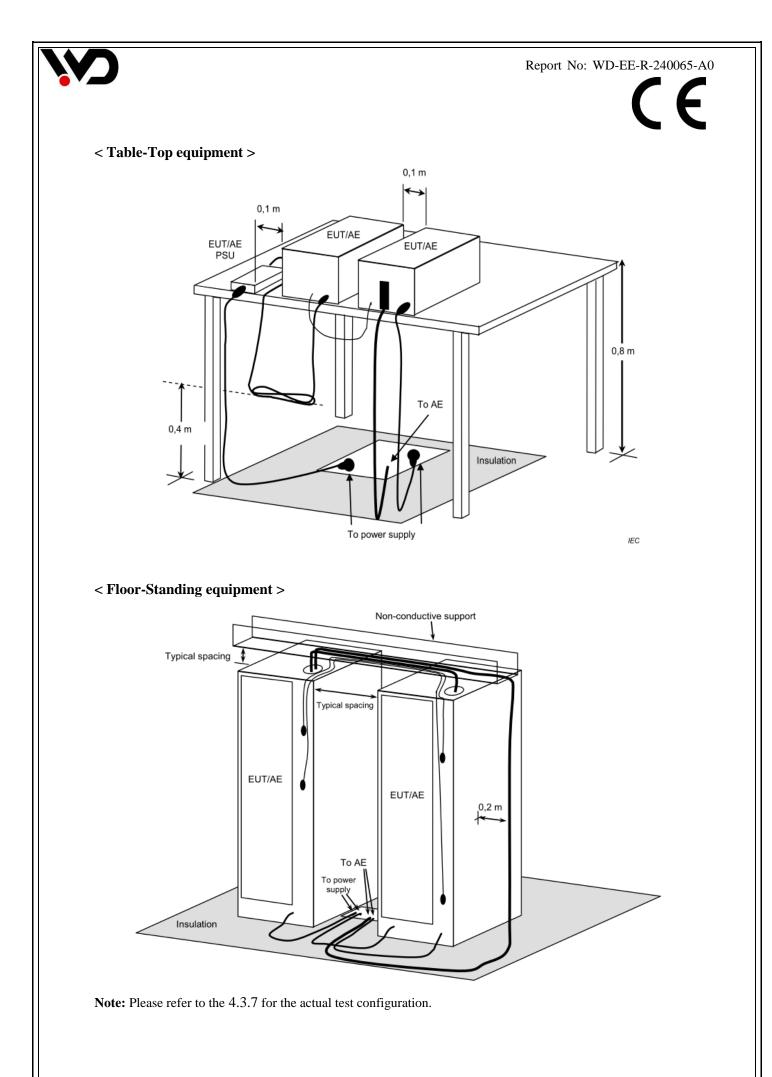

< Radiated Emissions Frequency: 30 MHz to 1000 MHz >

#### Note:

- (1) Please refer to the 4.3.7 for the actual test configuration.
- (2) The formula of measured value as: Test Result = Reading + Correction Factor
- (3) Detector function in the form: PK = Peak, QP = Quasi Peak, AV = Average
- (4) The test result calculated as following:
- Measurement Value = Reading Level + Correct Factor Correct Factor = Antenna Factor + Cable Loss - Amplifier Gain (if use) Margin Level = Measurement Value - Limit Value

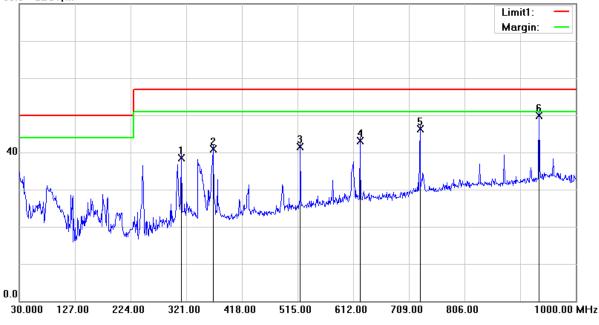

#### 4.3.6 Test Result

#### 4.4 Harmonics Current Measurement

#### 4.4.1 Limits of Harmonics Current Measurement

The limits ensure that harmonic disturbance levels do not exceed the compatibility levels defined in IEC 61000-3-2.

| Limits for         | Limits for Class A equipment       |  |  |  |  |  |
|--------------------|------------------------------------|--|--|--|--|--|
| Harmonics<br>Order | Max. permissible harmonics current |  |  |  |  |  |
| n                  | А                                  |  |  |  |  |  |
| Ode                | d harmonics                        |  |  |  |  |  |
| 3                  | 2.30                               |  |  |  |  |  |
| 5                  | 1.14                               |  |  |  |  |  |
| 7                  | 0.77                               |  |  |  |  |  |
| 9                  | 0.40                               |  |  |  |  |  |
| 11                 | 0.33                               |  |  |  |  |  |
| 13                 | 0.21                               |  |  |  |  |  |
| 15<=n<=39          | 0.15x15/n                          |  |  |  |  |  |
| Eve                | n harmonics                        |  |  |  |  |  |
| 2                  | 1.08                               |  |  |  |  |  |
| 4                  | 0.43                               |  |  |  |  |  |
| 6                  | 0.30                               |  |  |  |  |  |
| 8<=n<=40           | 0.23x8/n                           |  |  |  |  |  |

| Limits for Class D equipment |                            |                   |  |  |  |  |  |  |  |

| 13                           | 0.30                       | 0.21              |  |  |  |  |  |  |  |
| 15<=n<=39                    | 3.85/n                     | 0.15x15/n         |  |  |  |  |  |  |  |

- Note: 1. Class A and Class D are classified according to item section 5 of EN 61000-3-2.
  - 2. According to section 7 of EN 61000-3-2, the above limits for all equipment except for lighting equipment having an active input power > 75 W and no limits apply for equipment with an active input power up to and including 75 W.

#### 4.4.2 Test Instrument

| Item | Equipment                          | Manufacturer | Model       | Meter No.   | Calibration<br>Date |
|------|------------------------------------|--------------|-------------|-------------|---------------------|
| 1    | Harmonics &<br>Flicker<br>Analyser | EMC PARTNER  | HAR-1000-1P | CT-1-090(1) | Oct. 19, 2023       |
| 2    | Power Source                       | EMC PARTNER  | PS3-1       | CT-1-090a1  | Oct. 19, 2023       |

Note: 1. The calibration interval of the above test instruments is 12 months.

The table-top EUT was placed on the top of a wooden table 0.8 meter above the ground and operated to produce the maximum harmonic under normal operating conditions for each successive harmonic component in turn. The floor-standing EUT was placed insulation support unit from the horizontal ground plane.

The classification of EUT is according to section 5 of EN 61000-3-2.

The EUT classified as follows:

Class A:

- Balanced three-phase equipment;
- Household appliances excluding equipment identified as Class D;
- Tools excluding portable tools;
- Dimmers for incandescent lamps;
- Audio equipment.

Equipment not specified in one of the three other classes should be considered as Class A equipment. Note 1: Equipment that can be shown to have a significant effect on the supply system may be reclassified in a future edition of the standard. Factors to be taken into account include:

- Number in use;
- Duration of use;
- Simultaneity of use;
- Power consumption;
- Harmonic spectrum, including phase.

#### Class B:

- Portable tools;
- Arc welding equipment, which is not professional equipment.

#### Class C:

- Lighting equipment;

#### Class D:

Equipment having a specified power according to 6.2.2 less than or equal to 600W, of the following types:

- Personal computers and personal computer monitors;
- Television receivers.

- Refrigerators and freezers having one or more variable-speed drives to control compressor motor(s).

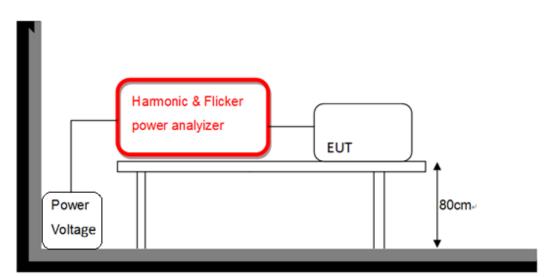

#### 4.4.4 Deviation from Test Standard

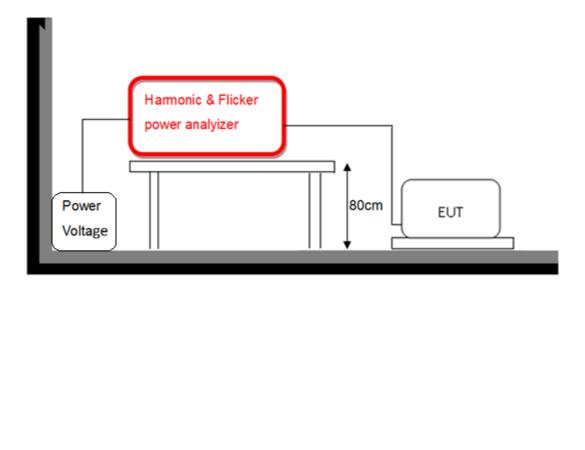

No deviation

#### 4.4.5 Test Setup

#### 4.5 Voltage Fluctuation and Flicker Measurement

#### **4.5.1** Limit for Voltage Function and Flicker Measurement

| Tests Item           | Limits<br>IEC/EN 61000-3-3 | Remark   |
|----------------------|----------------------------|--|
| Pst                  | 1.0, Tp= 10 min.           | P <sub>st</sub> means short-term flicker           |
| P <sub>lt</sub>      | 0.65, Tp=2 hr.             | P <sub>lt</sub> means long-term flicker            |
| dc (%)               | 3.3%                       | dc means relative steady-state voltage change      |
| d <sub>max</sub> (%) | 4%                         | $d_{max}$ means maximum relative voltage change.   |
| T <sub>dt</sub>      | 3.3% / 500 ms              | $T_{dt}$ means maximum time that dt exceeds 3.3 %. |

#### 4.5.2 Test Instrument

| Item | Equipment                          | Manufacturer | Model       | Meter No.   | Calibration<br>Date |
|------|------------------------------------|--------------|-------------|-------------|---------------------|
| 1    | Harmonics &<br>Flicker<br>Analyser | EMC PARTNER  | HAR-1000-1P | CT-1-090(1) | Oct. 19, 2023       |
| 2    | Power Source                       | EMC PARTNER  | PS3-1       | CT-1-090a1  | Oct. 19, 2023       |

Note: 1. The calibration interval of the above test instruments is 12 months.

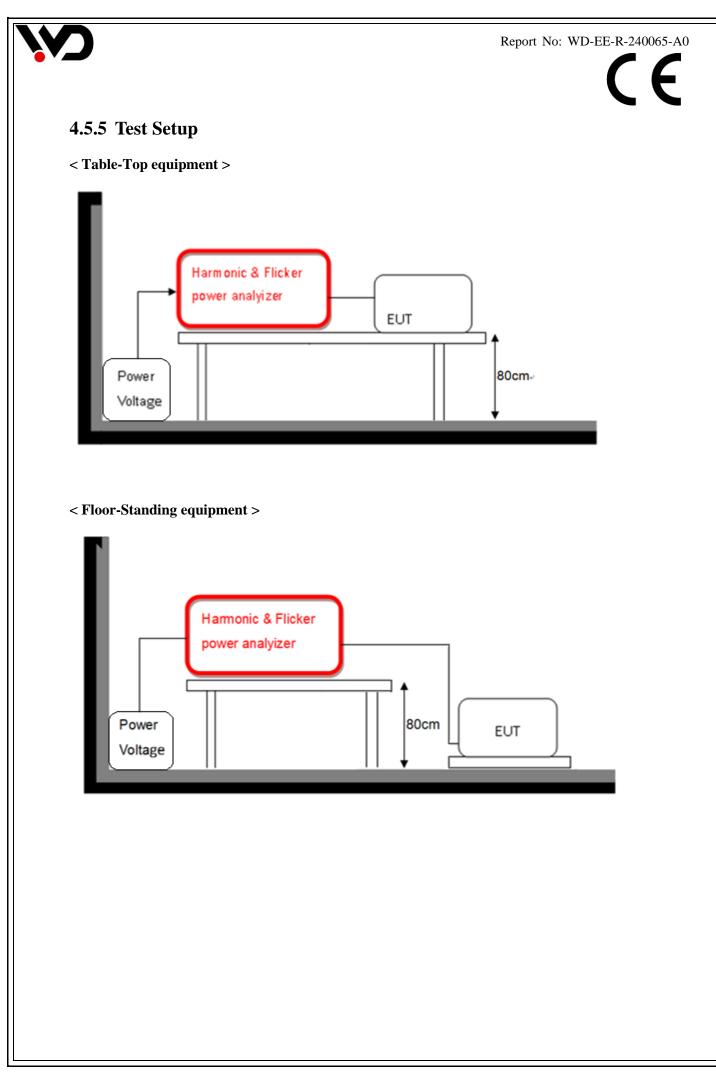

#### 4.5.3 Test Procedure

The table-top EUT was placed on the top of a wooden table 0.8 meter above the ground and operated to produce the most unfavorable sequence of voltage changes under normal operating condition. The floor-standing EUT was placed insulation support unit from the horizontal ground plane.

During the flick measurement, the measure time shall include that part of whole operation cycle in which the EUT produce the most unfavorable sequence of voltage changes. The observation period for short-term flicker indicator is 10 min and the observation period for long-term flicker indicator is 2 hours.

#### 4.5.4 Deviation from Test Standard

No deviation

#### 4.5.6 Test Result

| Supply Voltage /<br>Ampere | 229.5 Vrms /<br>0.260 Arms | Test Date                   | 2024/02/29   |
|----------------------------|----------------------------|-----------------------------|--------------|
| Observation (Tp)           | 30 min                     | Environmental<br>Conditions | 22°C, 49% RH |
| Power Frequency            | 49.935Hz                   | Tested by                   | Guanwei Liao |

| Test Parameter             | Measurement Value | Test Limit | Remarks |
|----------------------------|-------------------|------------|---------|
| $\mathbf{P}_{\mathrm{st}}$ | 0.07              | 1.00       | Pass    |
| P <sub>lt</sub>            | 0.07              | 0.65       | Pass    |
| T <sub>dt</sub> (ms)       | 0.00              | 500        | Pass    |
| d <sub>max</sub> (%)       | 0.00              | 4%         | Pass    |
| dc (%)                     | 0.02              | 3.3%       | Pass    |

Note: 1. P<sub>st</sub> means short-term flicker indicator.

2. 3. Plt means long-term flicker indicator.

 $T_{dt}$  means maximum time that dt exceeds 3.3 %.

4.  $d_{max}$  means maximum relative voltage change.

5. dc means relative steady-state voltage change.

### 5.2 Performance Criteria

According to Clause 8 of EN 55035 standard, the general performance criteria as following:

| Criteria A | The equipment shall continue to operate as intended without operator intervention. No degradation of performance, loss of function or change of operating state is allowed below a performance level specified by the manufacturer when the equipment is used as intended. The performance level may be replaced by a permissible loss of performance. If the minimum performance level or the permissible performance loss is not specified by the manufacturer, then either of these may be derived from the product description and documentation, and by what the user may reasonably expect from the equipment if used as intended.   |
|------------|--|
| Criteria B | During the application of the disturbance, degradation of performance is allowed.<br>However, no unintended change of actual operating state or stored data is allowed to<br>persist after the test.<br>After the test, the equipment shall continue to operate as intended without operator<br>intervention. No degradation of performance or loss of function is allowed, below a<br>performance level specified by the manufacturer, when the equipment is used as<br>intended. The performance level may be replaced by a permissible loss of performance.<br>If the minimum performance level (or the permissible performance loss), or recovery<br>time is not specified by the manufacturer, then either of these may be derived from the<br>product description and documentation, and by what the user may reasonably expect<br>from the equipment if used as intended. |
| Criteria C | Loss of function is allowed, provided the function is self-recoverable, or can be restored<br>by the operation of the controls by the user in accordance with the manufacturer's<br>instructions. A reboot or re-start operation is allowed.<br>Information stored in non-volatile memory, or protected by a battery backup, shall not<br>be lost.   |

## **5.3 Electrostatic Discharge (ESD)**

### 5.3.1 Test Specification

| Standard                        | IEC/EN 61000-4-2                           |
|---------------------------------|--|
| Discharge Impedance             | 330 ohm / 150 pF                           |
| Discharge Veltage               | Air Discharge: ±2, ±4, ±8 kV (Direct)      |
| Discharge Voltage               | Contact Discharge: ±4 kV (Direct/Indirect) |
| Number of Discharge             | Air: Minimum 10 times at each point.       |
| Number of Discharge             | Contact: Minimum 10 times at each points   |
| Discharge Mode Single Discharge |  |
| Discharge Period                | 1 second minimum                           |

#### 5.3.2 Test Instrument

| Item | Equipment                        | Manufacturer | Model     | Meter No. | Calibration<br>Date |
|------|----------------------------------|--------------|-----------|-----------|---------------------|
| 1    | ESD Generator                    | TESEQ        | NSG 437   | CT-1-140  | Sep. 25, 2023       |
| 2    | ESD Generator                    | NoiseKen     | ESS-B3011 | CT-1-089  | Aug. 04, 2023       |
| 3    | Digital<br>Thermo-Hygro<br>Meter | N/A          | HTC-8     | CT-2-047  | Jun. 06, 2023       |
| 4    | Atmosphere pressure meter        | TES          | TES-1161  | CT-5-094  | Aug. 10, 2023       |

**Note:** 1. The calibration interval of the test instruments is 12 months.

2. The calibration interval of thermo hygrometer/ Atmosphere pressure meter is 24 months.

#### 5.3.3 Test Procedure

The test generator necessary to perform direct and indirect application of discharge to the EUT in following methods:

a. Contact discharges to the conductive surface and coupling planes:

For table-top equipment one of the test points shall be the centre front edge of the horizontal coupling plane, which shall be subjected to at least 20 indirect discharges (10 of each polarity). All other test points shall each receive at least 20 direct contact discharges (10 of each polarity). All areas normally touched by the user should be tested. Test shall be performed at a maximum repetition rate of one discharge per second.

#### Vertical Coupling Plane (VCP):

The coupling plane, of dimensions  $0.5 \text{ m} \times 0.5 \text{ m}$ , is placed parallel to, and positioned at a distance 0.1 m from, the EUT, with the discharge electrode touching the coupling plane. The four faces of the EUT will be performed with electrostatic discharge.

#### Horizontal Coupling Plane (HCP):

The coupling plane, of dimensions  $1.6 \text{ m} \times 0.8 \text{ m}$ , is placed under the EUT. The generator shall be positioned vertically a distance of 0.1 m from the EUT, with the discharge electrode touching the coupling plane. The four faces of the EUT will be performed with electrostatic discharge.

b. Air discharge at apertures and slots and insulating surface:

On those parts of the EUT where it is not possible to perform contact discharge testing, the equipment should be investigated to identify user accessible points where breakdown may occur. Such points are tested using the air discharge method. This investigation should be restricted to those area normally handled by the user. A minimum 10 single air discharges shall be applied to the selected test point for each such area.

Note: 1. The calibration interval of the above test instruments is 12 months.

#### 5.4.3 Test Procedure

The test procedure was in accordance with IEC 61000-4-3.

The table-top EUT and load, which are placed on a table that is 0.8 meter above ground, are placed with one coincident with the calibration plane such that the distance from antenna to the EUT was 3 meters.

Both horizontal and vertical polarization of the antenna and four sides of the EUT are set on measurement.

The EUT shall be positioned so that the four sides of the EUT shall be exposed to the electromagnetic field in sequence. In each position the performance of the EUT will be investigated.

In the case where the most sensitive surface side of the EUT is known throughout the frequency range (for example, via preliminary tests), testing may be restricted to that surface side only. Where it is not possible to determine the most sensitive face with any certainty (for example where different faces are sensitive at different frequencies) all four faces shall be tested.

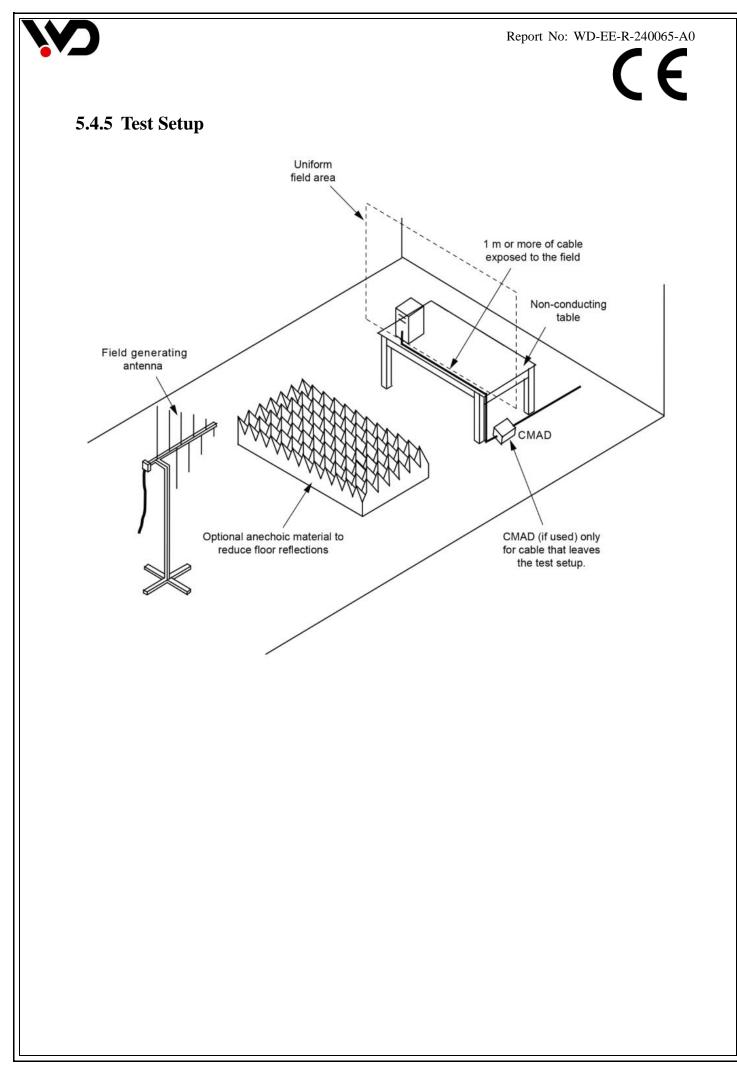

If the EUT is too large such that it cannot be fully illuminated by the radiating antenna, or exceeds the size of the Uniform Field Area (UFA) then partial illumination shall be used. The EUT can be repositioned so that the front surface remains within the UFA in order to illuminate those sections of the EUT that were previously outside the UFA.

In order to judge the EUT performance, a CCD camera is used to monitor EUT screen. All the scanning conditions are as follows:

|   | Condition of Test                          | Remarks              |
|---|--|----------------------|
| 1 | Field Strength 3V/m                        |                      |
| 2 | Radiated Signal AM 80% Modulated with 1kHz |                      |
| 3 | Scanning Frequency                         | 80M - 1000MHz        |
| 4 | Spot Frequency for Wireless                | 1800MHz, 2600MHz,    |
| 4 | communication device                       | 3500MHz, 5000MHz     |
| 5 | Dwell Time                                 | 3.0 seconds or       |
| 5 | Dwen Time                                  | not exceed 5 seconds |
| 6 | Frequency Step Size $\Delta f$             | 1%                   |

**F** 

## 5.5.3 Test Procedure

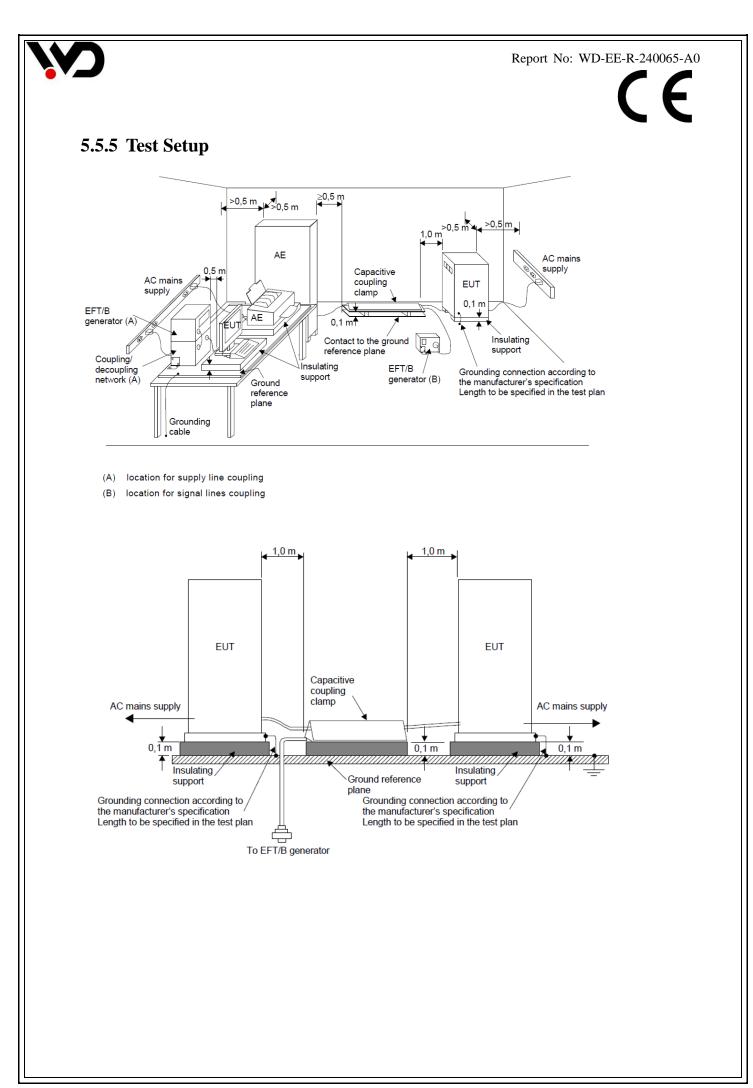

The table-top EUT was placed on a table that is 0.8 meter height. A ground reference plane is placed on the table, and uses 0.1m insulation between the EUT and ground reference plane. The floor-standing EUT was placed on 0.1m insulation support unit between the EUT and ground reference plane. The minimum area of the ground reference plane is  $1m \times 1m$ , and 0.65mm thick min, and projected beyond the EUT by at least 0.1m on all sides.

For input AC power ports:

The EUT is connected to the power mains through a coupling device that directly couples the EFT/B interference signal. Each of the line conductors is impressed with burst noise for 1 minute. The length of the power lines between the coupling device and the EUT is 0.5m.

## 5.5.4 Deviation from Test Standard

# 5.6 Surge Immunity Test

### **5.6.1 Test Specification**

| Standard                   | IEC/EN 61000-4-5   |
|----------------------------|--|
|                            | AC Main Power Port:  |
|                            | 1.2/50 µs Open Circuit Voltage, 8/20 µs Short Circuit Current  |
|                            | DC Network Power Port (Note 1):  |
|                            | 1.2/50 µs Open Circuit Voltage, 8/20 µs Short Circuit Current  |
| Wave- Shape                | Analogue/Digital Data Ports (unshielded symmetrical) (Direct to  |
| wave- Snape                | outdoor cables <sup>(Note 2, 3)</sup> ):   |
|                            | 10/700 µs Open Circuit Voltage, 5/320 µs Short Circuit Current   |
|                            | Analogue/Digital Data Ports (coaxial or shielded) (Direct to outdoor   |
|                            | cables <sup>(Note 2, 3)</sup> ):   |
|                            | 1.2/50 µs Open Circuit Voltage, 8/20 µs Short Circuit Current  |
|                            | AC Main Power Port:  |
|                            | line to line $\pm 1$ kV, line to ground $\pm 2$ kV,<br>DC Network Power Port (cable length > 3m): line to ground $\pm 0.5$ kV, |
|                            | Analogue/Digital Data Ports (unshielded symmetrical):line to ground $\pm 0.3 \text{ kV}$ ,                                     |
| Test Voltage               | Primary Protection: Intended $\pm 1$ kV and $\pm 4$ kV,  |
|                            | Primary Protection: Not Intended ±1 kV,  |
|                            | Analogue/Digital Data Ports (coaxial or shielded):   |
|                            | shielded to ground ±0.5 kV   |
| Surge Input / Output       | L1-L2, L1-PE, L2-PE  |
| Polarity Positive/Negative |  |
| Phase Angle                | 0°/90°/180°/270°   |
| Pulse Repetition Rate      | 1 time / min. (maximum)  |
| Times                      | 5 Positive and 5 Negative at selected points   |

**Note:** 1. Applicable only to port which, according to the manufacturer's specification, support cabled lengths greater than 3 m.

2 Surges are applied with primary protection fitted. Where possible, use the actual primary protector intended to be use in the installation. Where the surge coupling network for the 10/700 (5/320)  $\mu$ s wave affects the functioning of high speed data ports, the test shall be carried out using 1.2/50 (8/20)  $\mu$ s wave and appropriate coupling network.

 Surges are applicable to ports which satisfy all the following conditions: May connect directly to cables that leave the building structure. Defined as an antenna port, a wired network, or a broadcast receiver tuner port. Typical port covered include xDSL, PSTN, CATV, antenna and similar. Exclude ports are LAN and similar.

# 5.6.2 Test Instrument

| Item | Equipment       | Manufacturer | Model       | Meter No.   | Calibration<br>Date |
|------|-----------------|--------------|-------------|-------------|---------------------|
| 1    | Surge Generator | HAEFELY      | AXOS8       | CT-1-059(1) | Aug. 07, 2023       |
| 2    | Surge CDN       | 3cTest       | CDN-405T8A1 | CT-1-074(5) | May 26, 2023        |

Note: 1. The calibration interval of the above test instruments is 12 months.

# 5.6.3 Test Procedure

The EUT is placed on a table that is 0.8 meter above a metal ground plane measured  $1m \times 1m$  minimum and 0.65mm thick minimum and projected beyond the EUT by at least 0.1m on all sides. The length of power cord between the coupling device and the EUT shall be 2m or less.

For input AC power ports:

The EUT is connected to the power mains through a coupling device that directly couples the surge interference signal.

The surge noise shall be applied synchronized to the voltage phase at  $0^{\circ}$ ,  $90^{\circ}$ ,  $180^{\circ}$ ,  $270^{\circ}$  and the peak value of the AC voltage wave. (Positive and negative)

Each of Line to Earth and Line to Line is impressed with a sequence of five surge voltages with interval of 1 minute.

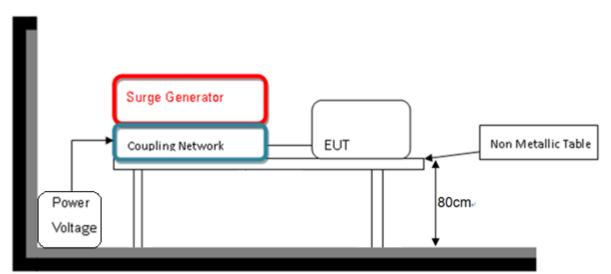

# 5.6.4 Deviation from Test Standard

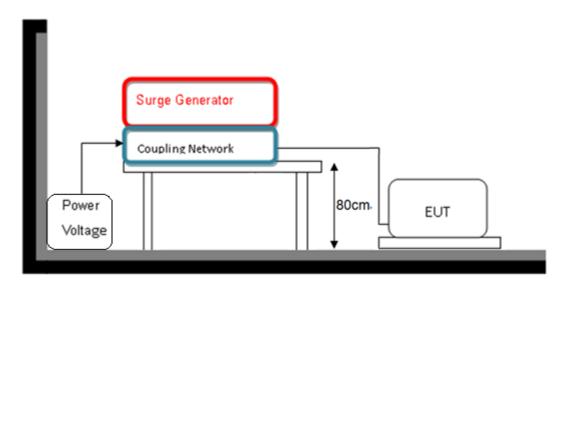

No deviation

# 5.7.3 Test Procedure

The EUT is placed on 0.1m insulation support unit between the EUT and ground reference plane.

#### For input AC power ports:

The EUT is connected to the power mains through a coupling and decoupling networks for power supply lines. And directly couples the disturbances signal into EUT.

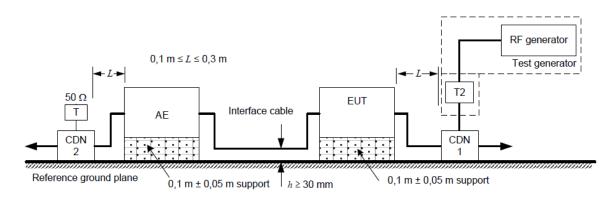

Auxiliary equipment (AE) required for the defined operation of the EUT according to the specifications of the product committee.

# 5.7.4 Deviation from Test Standard

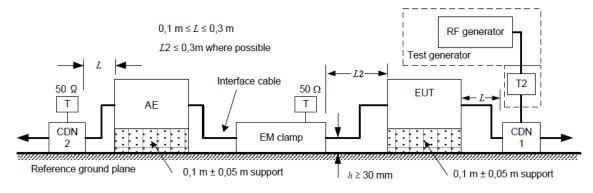

No deviation

## 5.7.5 Test Setup

#### The interface cable is set at 1 m if possible.

a) Schematic setup for a 2-port EUT connected to only 1 CDN

#### Note:

T: Termination 50  $\Omega$ 

T2: Power attenuator (6 dB)

CDN: Coupling and decoupling network

Injection clamp: current clamp or EM clamp

| Item | Equipment | Manufacturer | Model    | Meter No. | Calibration<br>Date |
|------|-----------|--------------|----------|-----------|---------------------|
| 1    | PFMF      | SGH          | HMFG1000 | CT-1-164  | Sep. 28, 2023       |

Note: 1. The calibration interval of the above test instruments is 24 months.

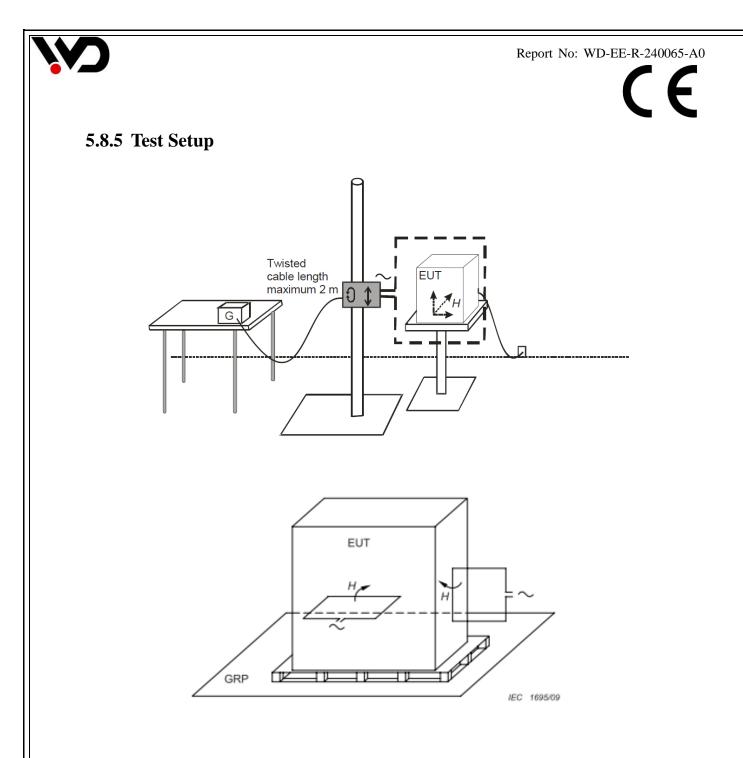

## 5.8.3 Test Procedure

The table-top EUT was placed on a table which is 0.8 meter above a metal ground plane measured at least  $1m \times 1m$  minimum. The test magnetic field shall be placed at central of the induction coil. The floor-standing EUT was placed on 0.1m insulation support unit between the EUT and ground reference plane.

The test magnetic Field shall be applied 10 minutes by the immersion method to the table-top EUT, and the induction coil shall be rotated by 90° in order to expose the EUT to the test field with different orientation (X, Y, Z Orientations). The test magnetic Field shall be applied 10 minutes by the proximity method to the floor-standing EUT, and the induction coil shall be rotated by 90° in order to expose the EUT to the test field with different orientation (X, Y, Z Orientations).

### 5.8.4 Deviation from Test Standard

No deviation

For the actual test configuration, please refer to 5.8.7.

#### NOTE:

#### TABLETOP EQUIPMENT

The equipment shall be subjected to the test magnetic field by using the induction coil of standard dimension (1 m x 1 m). The induction coil shall then be rotated by 90 degrees in order to expose the EUT to the test field with different orientations.

#### FLOOR-STANDING EQUIPMENT

The equipment shall be subjected to the test magnetic field by using induction coils of suitable dimensions. The test shall be repeated by moving and shifting the induction coils, in order to test the whole volume of the EUT for each orthogonal direction. The test shall be repeated with the coil shifted to different positions along the side of the EUT, in steps corresponding to 50 % of the shortest side of the coil. The induction coil shall then be rotated by 90 degrees in order to expose the EUT to the test field with different orientations.

# 5.8.6 Test Result

| Test Voltage | 230Vac, 50Hz | Environmental<br>Conditions | 21°C, 49% RH |
|--------------|--------------|-----------------------------|--------------|
| Tested by    | Alan Chung   | Test Date                   | 2024/02/29   |

| Test Coil Position | Frequency (Hz) | Magnetic Strength<br>(A/m) | Result |
|--------------------|----------------|----------------------------|--------|
| X - Axis           | 50/60          | 1                          | А      |
| Y - Axis           | 50/60          | 1                          | А      |
| Z - Axis           | 50/60          | 1                          | А      |

Note:

Criteria A: The EUT function was correct during the test.

# 5.9 Voltage Dips & Short Interruptions

# 5.9.1 Test Specification

| Basic Standard         | IEC/EN 61000-4-11  |
|------------------------|--|
| Test Level             | Voltage Dips:<br>>95% reduction - 0.5 period<br>30% reduction - 25 period<br>Voltage Interruptions:<br>>95% reduction - 250 period |
| Test Duration Time     | Minimum 3 test events in sequence  |
| Interval between Event | Minimum 10 seconds   |
| Phase Angle            | 0° / 180°  |
| Test Cycle     3 times |  |

**Note:** 1. Changes to occur at 0 degree crossover point of the voltage waveform. If the EUT does not demonstrate compliance when tested with 0 degree switching, the test shall be repeated with the switching occurring at both 90 degrees and 270 degrees. If the EUT satisfies these alternative requirements, then it fulfils the requirements. This condition shall be recorded in the test report.

## 5.9.2 Test Instrument

| Item | Equipment     | Manufacturer | Model    | Meter No. | Calibration<br>Date |
|------|---------------|--------------|----------|-----------|---------------------|
| 1    | DIP Simulator | 3ctest       | PFS2216S | CT-1-167  | Sep. 20, 2023       |

**Note:** 1. The calibration interval of the above test instruments is 12 months.

### 5.9.3 Test Procedure

Before starting the test of a given EUT, a test plan shall be prepared.

The test plan should be representative of the way the system is actually used.

Systems may require a precise pre-analysis to define which system configurations must be tested to reproduce field situations.

Test cases must be explained and indicated in the Test report.

It is recommended that the test plan include the following items:

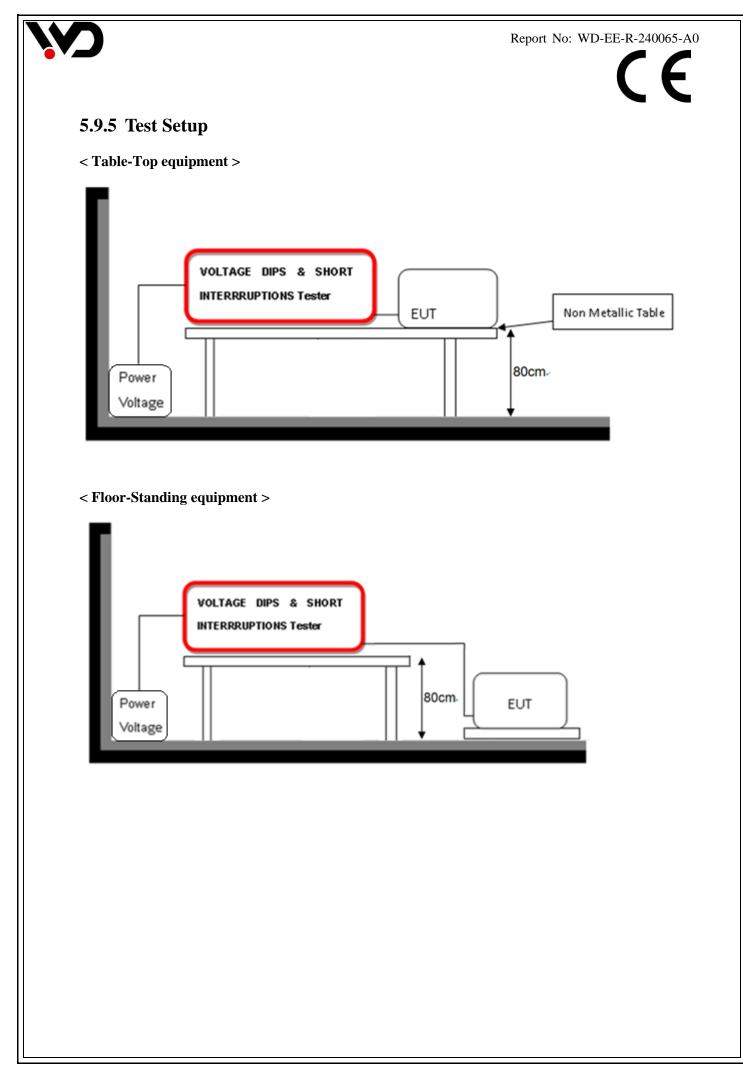

- the type designation of the EUT;
- information on possible connections (plugs, terminals, etc.) and corresponding cables, and peripherals;
- input power port of equipment to be tested;
- representative operational modes of the EUT for the test;
- performance criteria used and defined in the technical specifications;
- operational mode(s) of equipment;
- description of the test set-up.

If the actual operating signal sources are not available to the EUT, they may be simulated.

For each test, any degradation of performance shall be recorded. The monitoring equipment should be capable of displaying the status of the operational mode of the EUT during and after the tests. After each group of tests, a full functional check shall be performed.

### 5.9.4 Deviation from Test Standard

No deviation
